# CSC 228 Data Structures and Algorithms, Fall 2018 

Instructor: Dr. Natarajan Meghanathan
Exam 2 (Take Home)

Max. Points: 100

Due on: Nov. 8th @ 2.30 PM. Late submissions will NOT be accepted.
Print this exam and answer in the space provided. Staple and submit in class at the above time.
Given an array of integers, do the following (SHOW ALL THE STEPS; just writing the final answer will get only ZERO).

Clear label your answers for each of the sub parts (a) - (l), in the space provided.
(a -12 pts ) Construct a max heap of the array. Show the initial essentially complete binary tree and the transformation of the binary tree to a max heap via the reheapify operations at the indices of the internal nodes (as shown in the slides).
(b-12 pts) Sort the max heap version of the array obtained from (a) to obtain a sorted array of integers. Show the structural changes of the max heap in each iteration.
(c-7 pts) Transform the max heap of (a) to a binary search tree.
(d - 8 pts ) For the binary search tree obtained in (c), determine the average number of comparisons for a successful search and the average number of comparisons for an unsuccessful search.
(e-8 pts) Use the sorted array of (b) to construct a binary search tree.
(f - 7 pts ) For the binary search tree obtained in (e), determine the average number of comparisons for a successful search and the average number of comparisons for an unsuccessful search.
(g - 7 pts ) Construct a hash table of the given array using a hash function $\mathrm{H}(\mathrm{K})=\mathrm{K} \bmod 5$.
(h-7 pts) For the hash table of (g), determine the average number of comparisons for a successful search and the worst case number of comparisons for an unsuccessful search.
(i-14 pts) Consider the elements of the array assigned to you are known only one at a time. Construct a sequence of priority queues (as max heaps) with the insertion (enqueue) of one element at a time, as shown in the slides.
(j-7 pts) Transform the binary search tree of (c) to a min heap.
(k-7 pts) Transform the max heap of (a) to a min heap via reheapify operations at the internal nodes.
( $1-4 \mathrm{pts}$ ) Are the min heaps of $(\mathrm{j})$ and $(\mathrm{k})$ the same or not? What can you say about the distribution of the data in the min heaps of $(\mathrm{j})$ and $(\mathrm{k})$ ?

$\qquad$
(a -12 pts ) Construct a max heap of the array. Show the initial essentially complete binary tree and the transformation of the binary tree to a max heap via the reheapify operations at the indices of the internal nodes (as shown in the slides).
$\qquad$
(b-12 pts) Sort the max heap version of the array obtained from (a) to obtain a sorted array of integers. Show the structural changes of the max heap in each iteration.

Student Name:
J\#: $\qquad$
(c-7 pts) Transform the max heap of (a) to a binary search tree.
$\qquad$
(d - 8 pts) For the binary search tree obtained in (c), determine the average number of comparisons for a successful search and the average number of comparisons for an unsuccessful search.

Student Name:
J\#: $\qquad$
(e-8 pts) Use the sorted array of (b) to construct a binary search tree.

Student Name: $\qquad$ J\#: $\qquad$
(f - 7 pts ) For the binary search tree obtained in (e), determine the average number of comparisons for a successful search and the average number of comparisons for an unsuccessful search.

Student Name:
J\#: $\qquad$
( $\mathrm{g}-7 \mathrm{pts}$ ) Construct a hash table of the given array using a hash function $\mathrm{H}(\mathrm{K})=\mathrm{K} \bmod 5$.
$\qquad$
(h-7 pts) For the hash table of (g), determine the average number of comparisons for a successful search and the worst case number of comparisons for an unsuccessful search.
$\qquad$
(i - 14 pts) Consider the elements of the array assigned to you are known only one at a time. Construct a sequence of priority queues (as max heaps) with the insertion (enqueue) of one element at a time, as shown in the slides.

Student Name:
J\#: $\qquad$
(j-7 pts) Transform the binary search tree of (c) to a min heap.

Student Name:
J\#: $\qquad$
( $\mathrm{k}-7 \mathrm{pts}$ ) Transform the max heap of (a) to a min heap via reheapify operations at the internal nodes.

Student Name:
J\#: $\qquad$
( $1-4 \mathrm{pts}$ ) Are the min heaps of $(\mathrm{j})$ and (k) the same or not? What can you say about the distribution of the data in the min heaps of $(\mathrm{j})$ and $(\mathrm{k})$ ?
